UpTime

UpTime is a mobile app that helps users build healthier habits by combining limited social media use with a daily walking goal.

Architecture

- Model
 - Room (local) + Firestore (cloud)
- ViewModel
 - Dashboard, Walking, ScreenTime, Room, Auth, Notification
- View
 - Jetpack Compose, enum-based nav

UPTIME

Team Workflow

Cody Headings

- Navigation
- Room Customization
- Achievements
- Inventory
- Firebase Room Sync
- Room Visiting
- UI Polish
- Points currency and exchange screen

Jevon Chen

- Walking tracker stability improvement
- Screen time tracker UI and performance update
- Data pipelines (Repo → ViewModel)
- Permissions handling
- Notifications system with scheduling

Justin Lim

- Dashboard
- Room DB
- ViewModel
- Streak Calendar Report
- Firebase Auth
- Firestore Friends
- Profile

UPTIME

Debugging & Testing

Debugging Approach

- Logcat with Log.d / Log.e for tracking database writes, API calls, auth events, and sensor data
- Android Studio breakpoints for inspecting ViewModel state and coroutine execution
- Stack traces to identify root cause of crashes

Testing approach:

- Physical device testing across multiple Android versions
- App Inspection for verifying Room tables and data integrity
- Firebase Console for verifying Auth users and Firestore documents
- Manual edge case testing: offline mode, permission denial, day boundary rollover

UPTIME

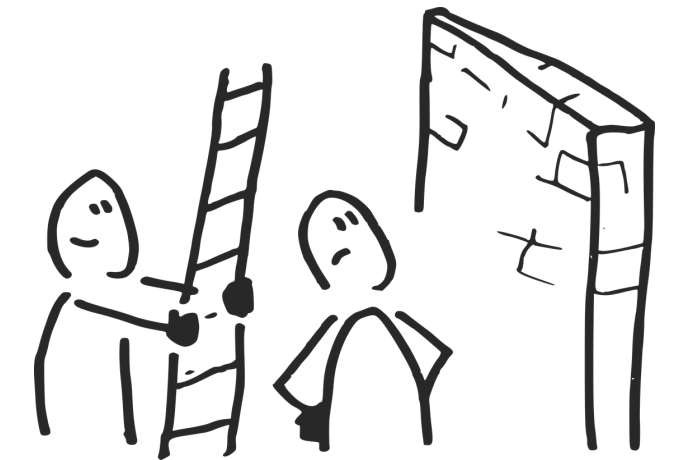

AI Use

- Dashboard UI Iteration
- Architecture guidance
- Debug (i.e. version mismatch)
- Documentation for README

Rejected: DataStore for user preferences, Hilt dependency injection (unfamiliar library),

Stretch Goals..

Completed

- Friends list with mutual add/remove via Firestore
- Firebase Auth with anonymous-to-account linking
- Cloud sync for user profiles, friends, and room data
- Room Customization with Achievements
- Monthly streak calendar
- Notification system
- View friends' rooms

In Progress

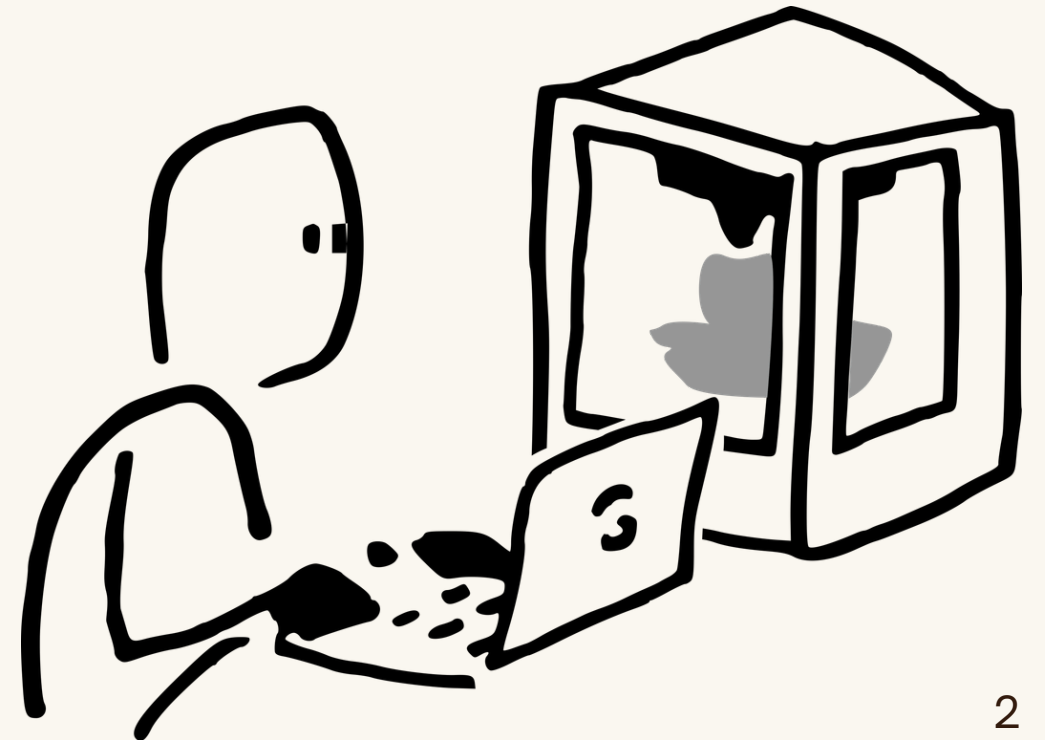

- Room Items and Layouts
- Final UI Improvements

Descoped

Smartwatch companion
